### Let's Start!

The True Meaning of Client in Computing.

### Learning Outcome:

Describe common activities at work to a using short sentences in familiar spoken and written situations.

Make the result report from the analysis of the information system, based on the customer requirements, following established rules and protocols.

### Can Do Statements:

- I can explain what a client is in computing.
- I can give examples related to different types of clients in computing.
- I can describe the role of the client in computing.

### Ask your partner:

- How do you think you can transfer information from one computer to another?
- What companies in Colombia offer computing services?

## Let's Explore!

One Last Wiki to Design.

*Instructions: Read the text below.*

- Manager:** I'm going to ask Karl to design a wiki. I'm thinking we can ask him to add client in computing to the wiki he designed last month because we're focusing on servers, computer hardware and computer software. I'm going to talk to him this afternoon, and I want to ask you to work with him. I'm going to send you a document with key information; we must include the concept of client in computing, the types of clients there are; and you should also include its role in computing. But first, can we discuss what this is before I leave?
- Philip:** Sure. I'm talking about client in computing in our next meeting, so I read some articles about the subject. I can tell you that a client is a computer hardware or software that sends a request to a server to access a specific service. This server is usually on another computer system.
- Manager:** What types of clients are you talking about in the meeting?
- Philip:** I'm going to explain that we can have fat, thin, and hybrid clients. Fat clients perform the bulk of any data processing operations by themselves, and they don't rely on a server. We should think of personal computers as an example of this type of clients. Then we have thin clients, which use the resources of the host computer and normally present only processed data that they receive from an application server. We can think of web applications such as Office Web Apps as an example. Finally, I'm talking about hybrid clients which combine the previous types of clients. They should process information locally, but rely on the server for storing certain data. We can think of video websites as an example of a hybrid client.
- Manager:** I must leave soon, could you quickly explain the role of the client in computing?
- Philip:** Sure, the primary function of a client-server system is to create a division of labor between a centralized server and the individual computers that are running your software. This helps businesses to create and process intensive applications.
- Manager:** Thank you! Let me know if you have to include extra information about the company in the wiki.

## Let's Practice!

### Types of Clients.

*Instructions: Select the correct option to correctly complete each sentence.*

1. We (can't / may / can) think of video websites as an example of hybrid clients.
2. We (shoe / should / should not) think of personal computers as an example of fat clients.
3. If we work with Office Web Apps, we (must / mustn't / most) be using a thin type of client.

## Let's Practice!

### Describing Roles of Clients in Computing.

*Instructions: Select the correct answer to complete the sentences.*

1. A client-server system has to \_\_\_\_\_ roles.  
(HINT: A client-server system creates a division of labor between a centralized server and the individual computers that are running the software.)  
a. rely  
b. bulk  
c. divide
2. Businesses usually need to \_\_\_\_\_intensive applications. This is why a client-server system is important for them.  
(HINT: a synonym of 'generate'.)  
a. create  
b. divide  
c. retrieve
3. A client is a computer program that has to \_\_\_\_\_access to a service that is usually located in a different network.  
(HINT: To ask for something.)  
a. request  
b. create  
c. divide
4. If I want my device to \_\_\_\_\_ the bulk of data processing operations, I have to use a fat client device.  
a. perform  
b. performed  
c. pierce
5. In a client-server system, the client has to retrieve information from the server using the network.  
(HINT: A client gets the information with the help of the server.)  
a. retrieve  
b. create  
c. rely

## Extension Activity

Describing types of clients.

*Instructions: Complete the following steps. Fill in the Self-Assessment.*

- Look for information about clients in computing.
- Describe how it works.
- Write a brochure talking about different types of clients.
- Show your brochure to your classmates and teacher.

### Self-Assessment

Yes

No

1. I look for information.

☐
☐

2. I describe the characteristics of clients.

☐
☐

3. I write a brochure.

☐
☐

4. I show my brochure to my students and teacher.

☐
☐

## Target Words

- **bulk** (noun): to something or someone that is very large  
e.g. Fat clients perform the bulk of any data processing operations by themselves, and they don't rely on a server.
- **centralized** (adjective): controlled by one main system or authority  
e.g. The primary function of a client-server system is to create a division of labor between a centralized server and the individual computers that are running your software.
- **store** (verb): to keep information  
e.g. They should process information locally, but rely on the server for storing certain data.
- **host computer** (noun): a controlling computer that provide data to other devices that are connected to it  
e.g. We have thin clients, which use the resources of the host computer and normally present only processed data that they receive from an application server.
- **rely** (verb): to depend on something  
e.g. Fat clients perform the bulk of any data processing operations by themselves, and they don't rely on a server.

## Learning Points

### Present Continuous For Plans and Be Going To For Intentions.

We can use **present continuous** and **be going to** to talk about plans we have for the future or to express our intentions.

#### PRESENT CONTINUOUS

We can use the **present continuous** to talk about plans we have for the near future. When using this tense, we are certain that we are going to carry the action out.

| Form                                    | Structure                                                                                     | Example                                                              |
|-----------------------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| <b>Affirmative</b>                      | Subject + <b>verb to be in simple present + main verb in -ing form</b> + complement           | <i>We <b>are working</b> with new clients next month.</i>            |
| <b>Negative</b>                         | Subject + <b>verb to be in simple present + not + main verb in -ing form</b> + complement     | <i>We <b>are not working</b> with new clients next month.</i>        |
| <b>Interrogative</b>                    | <b>Verb to be in simple present + subject + main verb in -ing form</b> + complement           | <i><b>Are</b> we <b>working</b> with new clients next month?</i>     |
| <b>Interrogative With Question Word</b> | <b>Wh word + verb to be in simple present + subject + main verb in -ing form</b> + complement | <i><b>Why are</b> we <b>working</b> with new clients next month?</i> |

Notice that when we use present continuous to talk about plans, we need to add a **time expression**.

## Learning Points

### BE GOING TO

We can use **be going to** to express intention or something we pretend to do in the future.

| Form                                    | Structure                                                                                                           | Example                                                                  |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <b>Affirmative</b>                      | Subject + <b>verb to be in simple present + going to + main verb in its base form</b> + complement                  | <i>You <b>are going to talk</b> to the manager before next week.</i>     |
| <b>Negative</b>                         | Subject + <b>verb to be in simple present + not + going to + main verb in its base form</b> + complement            | <i>You <b>are not going to talk</b> to the manager before next week.</i> |
| <b>Interrogative</b>                    | <b>Verb to be in simple present</b> + subject + <b>going to + main verb in its base form</b> + complement           | <i><b>Are you going to talk</b> to the manager before next week?</i>     |
| <b>Interrogative With Question Word</b> | <b>Wh word + verb to be in simple present</b> + subject + <b>going to + main verb in its base form</b> + complement | <i><b>Where are you going to talk</b> to the manager?</i>                |

### Examples

- *I'm going to ask Karl to design a wiki.*
- *I'm talking about client in computing in our next meeting, so I read some articles about the subject.*

## Learning Points

### Computer Network Diagrams.

A **computer network diagram** is used in computing and telecommunication to draw a graphic chart of a network.

A **computer network diagram** consists of a network that is made up of interconnected groups or systems. A network diagram is a visual representation of network architecture. It maps out the structure of a network with a variety of different symbols and line connections. It is the ideal way to share the layout of a network because the visual presentation makes it easier for users to understand how items are connected.

There are different computer network systems. Observe the chart below:

|                                |                                                                                                                                                                                              |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Basic Network Diagram</b>   | It is used to create simple network designs and network architecture diagrams. It uses basic network and computer equipment shapes.                                                          |
| <b>3D Network Diagram</b>      | It helps create the 3D perspective network.                                                                                                                                                  |
| <b>Detail Network Diagram</b>  | It is used to create detailed physical, logical and network architecture diagrams. It uses a comprehensive set of network and computer equipment shapes.                                     |
| <b>Logical Network Diagram</b> | It is the way in which signals act on the network media or, in which data passes through the network from one device to another without considering the physical interconnection of devices. |
