Let's Start!

Using Programming Tools to Improve Software.

Learning Outcome:

Describe common activities at work to a using short sentences in familiar spoken and written situations.

Make the result report from the analysis of the information system, based on the customer requirements, following established rules and protocols.

Can Do Statements:

- I can list a group of programming tools.
- I can explain the concept of programming tools.
- I can give examples of how programming tools work.

Ask your partner:

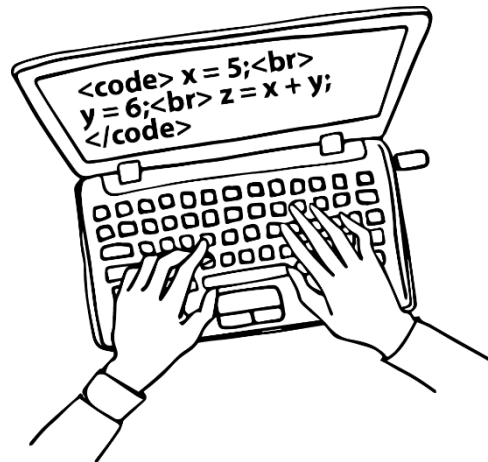

- What programming tools do you know about?
- What programming tools would you recommend to remove mistakes from a code?

Let's Explore!

Creating a Wiki About Programming Tools.

Instructions: Read the text below.

Martin: Hey, Karl. I need to create a wiki about programming tools, but I'm not familiar with it.

Karl: I have a good book I used in college. If we look at it, we can use it as a reference.

Martin: If I design the web layout, all the information is available; and, If we create a friendly website, many employees take advantage of this information.

Karl: We need to include three main chunks of information. First, the concept, then a list of programming tools, and we can add a section of examples of how they work.

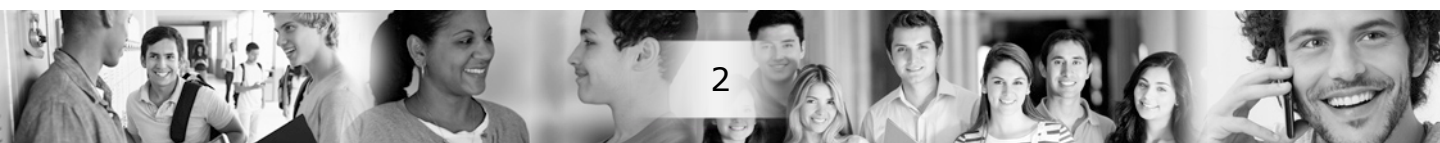

Martin: We should start with the concept; you can say a programming tool is a computer program used by software developers to create, debug, maintain, or support other programs to accomplish specific tasks. As a software developer, if I want to create new software, I use programming tools.

Karl: There is a science and technology article that lists a group of programming tools; it talks about source code editor, compiler, or interpreter as basic tools which software developers use permanently. Also, memory debugger is used by C++ as a programming tool to create a memory management and optimize memory efficiency.

Martin: If employees also know Dmalloc, Electric Fence, Insure++, Valgrind, we can include them in our wiki; these are examples of tools.

Karl: What about Bug databases? They are programming tools, right?

Martin: Yes, that is how each tool works. Bug databases are tracking systems, and it keeps track of software bugs reported; it's a type of issue tracking system. The programming tools list is wide. If you want to include them all, you have to design sub-navigation in your wiki; for example, a debugger, compilers, profilers' linkers, assemblers, disassemblers, load testers, and performance analysts. But for now, let's get to work!

**Let's Practice!**

Listing Programing Tools.

Instructions: Select the correct answer to complete the sentences.

1. If you _____ a source code into a programming language, you _____ a compiler.
 - a. translate / need
 - b. translate / needing
 - c. translates / needs
2. If you _____ to find memory leaks, you _____ a memory debugger.
 - a. needed / use
 - b. need / use
 - c. needs / uses
3. If you _____ a programmer, you _____ source code using a source code editor.
 - a. are / to write and edit
 - b. are / write and edit
 - c. be / write and edit

**Let's Practice!**

Explaining the Concept of Programming Tools.

Instructions: Circle the correct option to complete the sentences. Read the sentences aloud. Check your pronunciation with your partner.

1. Engineers (use / uses) programming tools to create a new software.
2. Programmers (apply / applying) tools in keeping software updated.
3. Developers (creates / create) software by using programming tools.

Extension Activity

Writing About How to Work of Programing Tools.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about programming tools.
- Identify the main programming tools.
- Write a short paragraph about how to work the main programming tools.
- Read your text to your classmates and instructor.

Self-Assessment

Yes No

- I look for information about programming tools.
- I identify the main programming tools.
- I write a short paragraph about how to work the main programming tools and I show my paragraph to my classmates and instructor.

☐	☐
☐	☐
☐	☐

Target Words

- **sub- navigation** (noun): internal options for moving around a website or computer screen, or between websites or screens.
e.g. You have to design sub-navigation in your wikiIf you want to include them all you have to design sub-navigation in your wiki.i.
- **tracking system** (noun): a set of computer equipment and programs used together for examining marks or pieces of information that show where the information is.
e.g. Bug databases are tracking systems, and it keeps track of software bugs reportedBug databases are tracking systems..
- **permanently** (adverb): always
e.g. It talks about source code editor, compiler, or interpreter as basic tools which software developers use permanently.It talks about source code editor, compiler or interpreter, as basic tools which software developers use permanently.
- **chunk** (noun): informal word to refer to a part of something, especially a large part
e.g. We need to include three main chunks of information.
- **debug** (verb): to remove mistakes from a computer program
e.g. A programming tool is a computer program used by software developers to create, debug, maintain, or support other programs to accomplish specific tasks.
- **assembler** (noun): a program that changes computer instructions into machine code using a set of numbers to give instructions to a computer
e.g. The programming tools list is wide; for example, a debugger, compilers, profilers linkers, assemblers, disassemblers, load testers, and performance analysts.

Learning Points

Zero Conditional in AffirmativeZero conditional in affirmative.

This The **zero conditional** is used when the result something will always happens under certain circumstances. The 'if' in this conditional can usually be replaced by 'when' without changing the meaning.

When using this conditional, you usually refers to general truths, such as scientific facts.

Structure:

If clause - Condition	Main clause – Result
If + Simple present	Simple present

Examples:

If clause (condition) - Main clause (result)

*If you **develop** software, you **need** a source code editor.*

*If you **run** a debugger, it **finds** mistakes in the code.*

If + simple present - simple present If something thing happens - another thing happens as a result.

Examples

- *If you want to include them all, you have to design include sub-navigation in your wiki.*
- *If we look at the book, we can use it as a reference.*
- *If I design the web layout, all the information is available.*

Learning Points

Words related to Programming tools.

A programming tool is a computer program used by software developers to create, debug, maintain, or support other programs to accomplish specific tasks.

Source code editor	It is a text editor program., It offers several features such as syntax highlighting, indentation, autocomplete, and bracket matching functionality.
Compiler	It is a computer program that allowsthat allows the main program to run into another computer program.
Interpreter	It is a computer program that directly performs, instructions written in a programming or scripting language.
Debugger	It is a computer program that is used to test and debug the "target" program.. Some debuggers offer two modes of operation—full or partial simulation—to limit this impact.
Profiler	It is a program analysis that measures, , the space, memory, the usage of particular instructions, or the frequency and duration of function calls. Profiler information serves to help program optimization.
